PagePress

Developer handoff brief | Chrome extension | 31 October 2026

Build objective: Capture all sheets displayed in a supported website document viewer, then download one clear PDF with separate pages or one JPEG per sheet. A working prototype already exists; review and extend it before rebuilding.

1. Expected user experience

Example: a website displays a 21-page land-record document. The user selects PDF, chooses all 21 pages with Pro, and clicks Capture once. The extension loads every sheet automatically and produces a **21-page PDF**, preserving each sheet's proportions. It must not create one long screenshot.

2. Automatic capture

- Detect the supported document viewer and total page count. Let the user choose the first and last page.
- Navigate through the selected sheets and wait for each render to finish before capturing it. Provide normal and slow-viewer settling options.
- Capture the full document sheet, including supported visible watermarks and annotation layers. Exclude browser toolbars, viewer controls and surrounding website content.
- Preserve portrait and landscape proportions, page order, and the complete page edges.
- Provide progress, Stop, and Retry missing pages. Retain completed captures locally. If a sheet fails, identify it and do not silently export an incomplete document.
- Restore the viewer's original page, zoom and scroll position after capture or cancellation.

3. Quality and export

- **High:** use the viewer's native 200% rendering. **Extra high:** use 300%. Capture the full rendered canvas rather than a screen-sized screenshot; do not upscale blurry pixels and call them high quality.
- **PDF:** one file, one original sheet per PDF page, preserving proportions. Embed retained PNG images without downsampling.
- **JPEG:** preserve captured pixel dimensions, use 95% JPEG quality with a white background, and bundle multiple images into one ZIP.
- Name JPEGs in document order, such as document-page-001.jpg. Add a Save JPEG button to each captured sheet, including completed sheets from an interrupted run.
- Allow switching export formats without recapturing the document. Mark a file Saved only after Chrome confirms download completion.

Quality boundary: higher zoom cannot recover detail absent from the original scan. The PDF is image-based; OCR, searchable text, interactive forms and original digital signatures are outside the initial scope.

Plans and payments

Free capture for short documents; licensed Pro access for longer ranges.

4. Free and Pro entitlements

Feature	Free	Pro
Pages per capture	Up to 5	Up to 200
PDF, JPEG and JPEG ZIP	Included	Included
200% / 300% quality	Included	Included
Stop and retry	Included	Included
Price	$0	US$19/year, recurring

Apply the page limit to the **full requested range**, including resumed captures. Changing formats must not bypass it. Existing captured sheets remain exportable after expiration or deactivation. Retain the current safety limits: approximately 150 MB of PNG data per capture and 32 million pixels per image. Device memory may impose lower limits.

5. Lemon Squeezy purchase and activation flow

- **Upgrade:** open the seller's hosted HTTPS checkout in a separate browser tab. Opening checkout or returning from it must not unlock Pro.
- **Activate:** the customer enters the license key from the purchase receipt and the checkout email. Validate the product and matching purchase email before consuming a browser activation slot.
- Use the public License API: POST /v1/licenses/validate, POST /v1/licenses/activate, and POST /v1/licenses/deactivate at https://api.lemonsqueezy.com. Follow the provider's current request contract.
- Check exact store ID, product ID, variant ID, license status, expiry and browser instance. Reject keys from other products, expired or disabled keys, and revoked instances.
- Persist the provider's instance ID. Revalidate when the panel opens and before each capture exceeding five pages. A saved local Pro flag must not grant access.
- Provide Verify license, Manage billing and Deactivate here. Manage billing opens the store's hosted customer portal. Deactivation frees this browser's activation; it does not cancel the subscription.
- If online verification fails, keep Free available and retain existing captures and credentials for retry. The current implementation has no offline Pro grace period.

6. Merchant setup still required

The seller has chosen Lemon Squeezy, but account setup is still pending. Create and activate the store, create a **US$19 yearly subscription**, enable license-key generation, and initially allow **2 browser installations**. Supply the public store ID, product ID, variant ID and hosted checkout URL. No secret seller API key belongs in the extension.

Configure seller identity, support contact, privacy/refund terms, subscription renewal and cancellation terms. Test the merchant checkout, receipt delivery, activation, renewal and expiry before enabling live sales. Provider approval and eligibility are external dependencies.

Implementation and delivery

Technical boundaries, acceptance criteria and source-package handoff.

7. Architecture, privacy and supported viewers

- Use Chrome Manifest V3 with a side panel. Existing libraries: jsPDF for PDF generation, html2canvas for supported visible overlays, and fflate for ZIP output. Bundle libraries and their licenses locally.
- Initial support targets PDF.js-style website viewers exposing readable full-sheet canvases and standard page/zoom controls. Detect accessible same-origin embedded viewers.
- Arbitrary websites, image galleries, Chrome's built-in PDF viewer, inaccessible cross-origin frames, protected canvases and viewers exposing only low-resolution full-sheet images need separate support. Do not bypass browser protections.
- Process documents locally. Store captures and license credentials in separate extension-origin IndexedDB databases. Clear capture must preserve the license; failed deactivation must retain credentials for retry.
- Use activeTab, scripting, sidePanel, storage and downloads as needed. Request optional access to the license API when the user activates or verifies Pro. Do not add permanent all-sites access.
- Never upload document images, document titles or document URLs to the payment provider. Keep card handling in hosted checkout. Disclose licensing requests and local credential storage in the privacy notice.
- Client-side license checks are not tamper-proof DRM: someone modifying the extension's source can remove local feature limits. Local credential storage is not an encrypted vault.

8. Acceptance criteria

- A 21-sheet supported source exports as 21 PDF pages and 21 ordered, readable JPEGs. Independent decoding confirms original captured dimensions, correct landscape proportions and intact watermarks and page edges.
- Stop/retry, slow loading, page failure, retained captures, format switching, individual JPEG downloads and original-view restoration work correctly.
- Free blocks captures over five pages. Valid Pro unlocks larger ranges and survives panel reopening. Invalid, wrong-product, expired, disabled and revoked keys do not unlock Pro.
- Checkout alone cannot unlock Pro. Verify activation limits, connection failures, deactivation, billing-portal navigation and subscription expiration/renewal. Deactivation must preserve document captures.
- Check desktop, 390 px and 320 px side-panel layouts. Verify Chrome installation, toolbar access, download prompts and live behavior on the actual target portal.

9. Source handoff and remaining verification

Share the project source and packaged extension alongside this PDF. Project-relative locations: **pagepress/extension/** (extension source), **pagepress/README.md**, **pagepress/PRIVACY.md**, **pagepress/BILLING-SETUP.md**, and **pagepress-extension.zip** (installable unpacked package after extraction). Keep the separate ReleaseCheck extension untouched.

The prototype is version 0.3.0. Automated work has exercised capture/export and licensing with simulated payment responses. **Actual merchant checkout is not yet verified or enabled.** The installed extension still needs a smoke test on the user's exact Bihar portal document. Do not advertise compatibility with every website.

Developer deliverables: updated source and ZIP, installation instructions, configured public billing settings, a test-results summary, accurate supported-viewer limitations, privacy notice, and a completed live checkout/activation check before public sales.
